

## **Boston Scientific Announces 1,000th Patient Treated with Precision™ Spinal Cord Stimulation System for Relief from Chronic Pain**

(July 11, 2005) -- Boston Scientific Corporation (NYSE: BSX) today announced that physicians have implanted the 1,000th Precision™ Spinal Cord Stimulation System for the treatment of chronic pain. The Precision system was launched nationwide in March of 2005 following earlier approval by the U.S. Food and Drug Administration. The Precision system is an implantable neurostimulator device that delivers electrical signals to the spinal cord, masking pain signals as they travel to the brain. It is the smallest rechargeable neurostimulator on the market today.

Timothy R. Lubenow, M.D., Professor of Anesthesiology and Director of Pain Medicine at the Rush University Medical Center in Chicago, performed the 1,000th surgery.

"The refinements and evolutionary advancements in spinal cord stimulation technology allow this exciting pain treatment to help those suffering from chronic pain," said Dr. Lubenow. "In this case, the patient's treatment with existing technologies was not effective in relieving his persistent low back pain. With the new Precision device, I am confident that his chronic back pain is being treated effectively. I was better able to target his pain while programming on the table. The patient reported that he felt better immediately after post-op."

"The rapid adoption of the Precision system is testimony to physicians embracing the advantages of a small, patient-friendly rechargeable neurostimulator," said Jeffrey Greiner, head of Boston Scientific's Neuromodulation Group. "We have raised the technological bar with our best-in-class neuromodulation system. In addition, we have more than a decade of clinical and service expertise, supporting more than 1,000 clinicians and 15,000 deaf infants, children and adults who use our cochlear implant neurostimulator to hear. We are building on this experience to provide world-class customer care to hundreds of pain management physicians and 1,000 Precision patients."

The Precision system consists of an implantable pulse generator (IPG) that delivers stimulation to the spinal cord using wire leads, as well as an external charging system. The long-lasting Precision® IPG is the smallest on the market - about half the size and considerably lighter than competing devices. The external charging system (which charges the implanted IPG) provides patients with greater convenience because it is significantly less bulky and more discreet. Spinal cord stimulation is prescribed for patients with chronic pain in the limbs, trunk, and back who have not received adequate pain relief from physical therapy, pain medications or other methods.
